Steam is one of the world's most popular platforms for accessing video games, and soon, you'll be able to play any titles you've purchased on it on your Android and iOS devices (including phones, tablets, and Android/Apple TV). This is being made possible thanks to a new app Valve's releasing called Steam Link, and it'll be free to download for both operating systems. It's an incredibly exciting proposition, but there are a couple things to take note of. iPhone 14 event, live! All the news as it happens, right here First off, and perhaps most important, you won't be able to play your games wherever you'd like. Your gadget must be connected to a 5GHz Wi-Fi network or hard-wired over Ethernet to ensure it's got a connection to your PC/Mac. In other words, you won't be able to access your library while on the bus or at Starbucks. In regards to controller support, Valve's said that Steam Link will support its own Steam Controller as well as MFI controllers. Valve notes that you'll also be able to use "more across both platforms", but that's as specific as it's gotten so far. Later this summer, Valve will also be launching a Steam Video app through which you'll be able to watch "thousands of movies and shows available on Steam" whether you're on Wi-Fi or LTE. Along with streaming over a data connection, you'll also be able to download shows for offline watching. Android P Beta hands-on: The best and worst features After announcing the upcoming launch of Steam Link and Steam Video apps for Android and iOS, Valve has decided to enable Bluetooth connectivity for the Steam Controller, thus allowing owners to connect it to a smartphone or tablet. The move is a necessary step before the launch of Steam Link app that's supposed to allow users to play their Steam games library on almost any Android or iOS device. The only requirement would be that your phone or tablet (or TV) is on the same 5GHz network as the host PC or it's connected to the computer via Ethernet cable. Until Steam Link app goes live in the week of May 21, Valve announced that starting this weekend, smartphone and tablet users will be able to pair them with the Steam Controller gamepad via Bluetooth. The Steam Controller comes with a special wireless dongle that's still recommended to use, but if your smartphone or tablet doesn't have a USB port, you can still pair the Steam Controller via Bluetooth, which, according to Valve, should be "excellent." In order to take advantage of the new feature, you'll have to opt into the latest Steam Client Beta and update to the latest firmware. Keep in mind that this still in beta, so there's a chance that you might experience some issues. Bungie's finally shown us what Destiny 2 will look like in a post-Activision world, this morning revealing its forthcoming second major expansion Shadowkeep, which will take players to the moon (and bring back the moon wizards) starting September 17. But one small detail in particular stands out, a side effect of the split: After two years, Destiny 2 is coming to Steam. It's hard to know what this will entail at the moment, as the details are slightly murky. How do current Battle.net owners get their Steam copy? Can they even? Are you going to get a Steam key in the mail? Will a legacy version remain on Battle.net? None of that's been detailed yet. Bungie announced cross-platform characters and save transferring today, so presumably all your progress will translate seamlessly to Steam, but the rest is less obvious, the finicky behind-closed-door business details that make this change possible. Even so, I'm excited. It's always felt weird launching Destiny 2 from Battle.net, and even more so after the Activision breakup. Making Steam the primary PC platform is a small change in theory, but a much larger statement of intent—almost a relaunch of the game, as far as PC players are concerned. Shadowkeep looks like a great expansion to do it with, as well. Aside from the cinematic trailer, Bungie spent quite a bit of time breaking down how the philosophy behind Destiny 2 has changed, and it sounds promising. A key point is the aforementioned character transferring. Starting with Shadowkeep's arrival in September, you'll be able to move seamlessly between PC, Xbox One, PlayStation 4, and eventually Google's Stadia streaming platform, keeping your character and progress. The fractured ecosystem's been annoying ever since the PC version of Destiny 2 launched a month after the console versions, so I'm glad that's finally getting cleaned up. Shadowkeep is also a standalone expansion, meaning you don't need to buy baseline Destiny 2 or any of the middling first-year expansions or any of that garbage—another great move. I'll be curious how the leveling system adapts to this, but again it makes Shadowkeep essentially a relaunch of Destiny 2. And maybe the solution is found in Destiny: New Light. This is one of the biggest surprises, with some version of Destiny 2 set to go free-to-play when Shadowkeep launches. If I had to guess, this would encompass at least the base game, original Destiny 2 campaign, and the original set of planets, with players then able to add paid expansions on top. Forsaken would be a cherry on top though, and might alleviate some of the platform migration woes. Existing Destiny 2 owners would move to Steam "for free," while newcomers and players going forward could purchase Shadowkeep and experience the new content. In any case, those of you worried what Destiny 2 would look like post-Activision, I think it's safe to breathe now. We'll keep you updated if we hear further details on this brave post-Battle.net future. No new notifications You'll get updated when important things are happening, and when you engage with our community. NVIDIA GeForce Now (Image credit: Android Central) Best answer: Yes! NVIDIA GeForce Now supports a lot of games, most of which are playable through your Steam library. GeForce Now says it now support more than 2,000 games that can be played through single-session installs, which also utilizes your Steam library. In essence, if you own a game on Steam, there's a chance you can play it on GeForce Now. What is NVIDIA GeForce Now? Labor Day sales highlights - Phones, laptops, speakers, and more Initially revealed in 2017, GeForce Now is a game streaming service that allows players to access NVIDIA's servers to stream games they already own. Unlike other services that have you buy games in order to play them on a service, GeForce Now allows players to play mostly whatever is in their gaming library already. Thankfully, playing games is just as easy as the service sounds, as players can quickly boot up the app on a computer, select a game and install it, and be playing right away. Because GeForce Now is also supported on Android devices and the NVIDIA Shield, you can also take your games on the go, and play high-end titles no matter where you are. After being in beta for nearly three years, the service is now open to everyone in two formats. Players who want to experience GeForce Now can sign up for free, but will be limited to one-hour sessions of gaming. On the other hand, there is a Founders membership currently available, which gives players access to the service for a \$5 per month fee. Players who subscribe to the Founders membership will get the added benefit of priority access into the service, as well as extended gaming sessions, which means they'll be able to play for hours at a time. It's important to note, though, that there is a chance the price of GeForce Now will go up in the future. Can you play Steam games on GeForce Now? As stated above, GeForce Now works in conjunction with your gaming library, meaning nearly everything in your Steam library is available to play. This works by either selecting the game you want to play from the GeForce Now app, or through the use of single-session installs. Installing a game is pretty easy, and involves going through the same process you normally would, only on the GeForce Now app. Save data is synced through Steam as well, meaning that you can play games on GeForce Now and pick them up somewhere else should you need to. You can check out the full list of games available on GeForce Now over on its website (opens in new tab), which also lists whether the game is available on Steam or not. While GeForce Now works with a large majority of games, there are some titles that won't work. For example, after working for most of the beta period, NVIDIA pulled all Activision Blizzard games from the service once it went live, although it hopes to gain them back sometime soon. Likewise, companies like EA, Capcom, and many others choose not to partner with GeForce Now. This is updating all the time, so we'll be sure to alert you of any changes. If you want to take your Steam games around the house in the palm of your hand, there's only one way to make it happen: via the Steam Link mobile app. (Image credit: Valve) With this app, PC gamers can stream their Steam games directly to their smartphones (provided they have a 5-GHz wireless network). This means that as long as your phone is on the same 5-GHz Wi-Fi network as your gaming PC, you'll be able to play any game in your Steam library with nothing but your cell-phone and a Bluetooth controller. To use the Steam Link mobile app, you'll need three items: a gaming PC, a smartphone and a Bluetooth-capable controller. While you can test the app and navigate menus without the controller, playing games will necessitate one. Once you have these three items, you can set up your stream. Here's how to get started. 1. Make sure streaming is enabled on your Steam account. Once you've installed the Steam games on your PC that you'd like to stream, as well as the Steam Link mobile app on your phone, make sure your account is set for the task. Go to your PC Steam client's Settings menu, select In-Home Streaming and check the Enable Streaming box. On the same page, set up a Steam Link PIN to sign in with; you'll use this later on in the process. 2. Link your controller to your phone. Create a Bluetooth pairing between your phone and your Bluetooth-capable controller. Bluetooth options can typically be found in your phone's settings menu. To pair a Bluetooth controller, you will likely need to input certain commands on it (refer to your specific controller's operating guide for details on this), then look for it under Available Devices on your phone's list of detected Bluetooth devices. Once the controller appears as a detected device, select it to pair your controller with your phone. 3. Launch the Steam Link app. As long as your phone and PC are on the same network, the app should detect them both and, via your phone, prompt you to enter a code on your PC. This will install some drivers onto your PC. 4. Enter your PIN. At this point, you will need to enter your custom PIN (the one you created in Step 1) on the app. Once that's done, the app should verify that your controller and PC are linked to your phone. 5. Start playing games. Once the Steam Link app confirms that your controller, PC and network are good to go, tap the app's Start Playing button. This will take you to a smartphone-size version of Steam Big Picture mode, from which you can select and play any Steam game already installed on your PC. Overall Impressions The Steam Link mobile app is simple to set up, user-friendly in its design and more than capable of doing its job, provided you have a 5-GHz wireless network. It offers total access to your installed library of Steam games with minimal frame loss and input lag, and it generally lives up to its promise — aside from one fatal flaw. When I tested Steam Link with multiple wireless DualShock 4 controllers, the app consistently refused to acknowledge them, even though the phone was paired with said controllers. Once in a blue moon, Steam Link would decide to recognize a DS4, but these moments of functionality were sporadic and brief. As Steam Link progresses and transitions out of its beta phase, we'll be conducting further tests of Bluetooth controller functionality and will update this guide accordingly. With that in mind, Steam Link is great — when it works. It provides a useful service and makes PC gaming a more comfortable, mobile experience. Credit: Valve
